

On July 26, Maria Teresa Carri died, at barely 60 years of age, after a very short and implacable illness, which fought with awareness and with the determination that was her own.

Full Professor of Biochemistry at the Department of Biology of the University of Rome Tor Vergata, she has worked with passion as a researcher in the field of the studies on Amyotrophic Lateral Sclerosis, achieving results and recognition of excellence, which have made her a reference figure for this topic in Italy and internationally.

Exemplary was her devotion to the training of students and young researchers, to whom she wanted to convey her rigor and her love for science.

The scientific and academic communities have lost a woman of exceptional human qualities, availability and generosity, that all those who got to know her as friends, colleagues, collaborators, students, including ALS patients were able to appreciate.

ESN expresses condolences to the family, collaborators and colleagues closest to her for the sudden and premature loss of Maria Teresa.
