A. Personal Statement

The research in my laboratory is focused on the cellular and molecular mechanisms of synaptic plasticity in the hippocampus, in particular on the role played by the neurotrophin brain-derived neurotrophic factor (BDNF). We are also interested in the alterations in the regulation of excitatory and inhibitory synapses in brain disorders characterized by excessive excitatory activity, such as in brain ischemia and in epilepsy. To address these questions we use a combination of experimental approaches, including cell cultures, subcellular fractionation, biochemistry, cellular and molecular biology and electrophysiology, as well as in vivo models of brain disorders. These studies are expected to contribute to the identification of novel therapeutic targets for stroke and epilepsy.
